Requested by: DR. DUCH SOKHEN

REPORT OF ULTRASONOGRAPHY

INDICATION: Liver cirrhosis?

TECNHIQUE: Ultrasound examination of the abdominal and pelvic.

FINDING:

- The liver is of normal, homogeneous echostructure, the contours are regular. Without apparent focal nodule.
- The portal vein, the inferior vena cava and the aorta are permeable and of normal size.
- No dilation of the intra- or extra-hepatic bile ducts.
- The gallbladder: normal size, thin wall, alithiasique.
- The spleen: normal size, homogeneous structure.
- The pancreas: poorly seen.
- The kidneys: normal structure and morphology, absence of kidney stone nor dilation of the excretory cavities.
- The bladder: thickened and regular wall (5mm in thickness), no stone.
- Prostate: normal size.
- Absence of peritoneal ganglion.
- Absence of thickening of the digestive wall in evidence.
- Mild intra-peritoneal fluid effusion (Morrison and Douglas).

IMPRESSION:

- No evidence of liver cirrhosis
- Urinary wall thickening: chronic cystitis?
- Mild intra-peritoneal fluid effusion (Morrison and Douglas)

Reported by:

Dr. LIM Lihaung
Consultant Radiologist
